We claim:

- A planar waveguide grating device, comprising:

 a şlab waveguide defining an input channel and a plurality of output channels; and
 an echelle grating having a multitude of facets, each of said facets being blazed

 with respect to a preselected channel position, and each facet having an elliptical curvature so as to be astigmatic with respect to the input channel and said preselected channel position.
 - 2. A planar waveguide grating device as claimed in claim 1, wherein different groups of facets are astigmatically blazed with respect to preselected sets of input channel and blazing positions.
 - 3. A planar waveguide grating device as claimed in claim 1, wherein said facets are arranged such that the input and output channels lie on a Rowland circle.
 - 4. A planar waveguide grating device as claimed in claim 1, wherein the input channel and the preselected output channel are located at the foci of an ellipse along a segment of whose locus the facets lie.
 - 5. A planar waveguide grating device as claimed in claim 4, wherein said echelle grating is configured to operate in at least the 20th order.
 - 6. A planar waveguide grating device wherein said echelle grating is configured to operate in at least the 450th order.
- 7. A planar waveguide grating device as claimed in claim 1, wherein is said slab waveguide and said echelle grating form an integrated device.
 - A method of making a planar waveguide grating device, comprising:
 providing a slab waveguide defining an input channel and a plurality of output
 channels; and
- forming an echelle grating having a multitude of facets, each of said facets being blazed with respect to a preselected output channel, and providing each facet with an elliptical curvature so that it is astigmatic with respect to the input channel and said preselected output channel.

5

- 9. A method as claimed in claim 8, wherein said facets are located such that said input and output channels lie on a Rowland circle.
- 10. A method as claimed in claim 8, wherein the input channel and the preselected output channel are located at the foci of an ellipse along a segment of whose locus the facets lie.
- 11. A method as claimed in claim 8, wherein said echelle grating is configured to operate in at least the 20th order.
- 12. A method as claimed in claim 8, wherein said echelle grating is configured to operate in at least the 450th order
- A method as claimed in claim 8, wherein said slab waveguide and said echelle grating are fabricated as an integrated device.
 - A method as claimed in claim 12, wherein said slab waveguide and said echelle grating are fabricated on a silicon wafer.
